Recycled fibres, Chemicals

### **Material**

Recovered paper can be produced both from collected newsprint, magazines and office waste. The paper is washed with water and treated with chemicals under high temperature and then filtered. Different fibres demand different processes and this determines the end product properties, and makes the fibre type (recovered or virgin) less important. The environmental benefits and economic feasibility of recovered paper as a raw material source depend on its availability, transport distance and the quality of the collected material.

Bleaching of fibres

Bleaching is a cleaning process of the fibres and the aim is to achieve a bright pulp, but also to get a certain purity of the fibre in order to achieve the demands for hygiene products and in some cases to meet the requirements for food safety. There are different methods used today for bleaching ECF (elementary chlorine free( where chlorine dioxide is used, and TCF (totally chlorine free) where ozone, oxygen and hydrogen peroxide is used.

### **Chemicals**

The chemicals used in the process as well as the functional chemicals are assessed from an environmental, occupational health and safety and product safety point of view . The used functional chemicals are:

Wetstrength agent  
Dry strength agent  
Dye = if coloured  
Fixing agents  
Fluorescent whitening agent  
Glue = if used

The process chemicals are:

Antipitch Protection agent  
Yankee coating  
Defoamer  
Dispersing agents and surfactants  
pH and charge control  
Retention aids  
Broke treatment chemicals  
Drainage aid
